#### FISHERY REPORT: CHAMPSOCEPHALUS GUNNARI HEARD ISLAND (DIVISION 58.5.2)

### 1. Details of the fishery

### 1.1 Reported catch

The trawl fishery for *Champsocephalus gunnari* in Division 58.5.2 has caught 365 tonnes from a catch limit of 1 658 tonnes in 2009/10 to 10 October 2010 (CM 42-02). Historical reported catches of *C. gunnari*, along with catch limits and number of vessels active in the fishery, are shown in Table 1.

Reported effort	Catch limit	Reported catch
(number of vessels)	(tonnes)	(tonnes)
-	-	5 860
-	-	7 525
-	-	9 710

Table 1:Catch history for Champsocephalus gunnari in<br/>Division 58.5.2 (source: STATLANT data for past<br/>seasons, and catch and effort reports for current season).

#### 1.2 IUU catch

2. There has been no evidence of IUU activity in this fishery.

#### **1.3** Size distribution of the catches

3. Catch-weighted length frequencies for *C. gunnari* from 1996/97 to 2009/10 are presented in Figure 1. Data from 2006/07 have not been included because the total catch for that season was 1 tonne.

#### Weighted Frequency (proportion of the catch)

Figure 1: Catch-weighted length frequencies for *Champsocephalus gunnari* in Division 58.5.2 (source: observer, fine-scale and STATLANT data). The plots include data from both the commercial fishery and research trawl surveys.

4. With respect to the catch-weighted length frequencies in Figure 1, the Working Group recalled the apparent progression in the cohorts in Figure 1 from 1999/2000 to 2002/03, and noted a similar pattern evident from 2003/04 to 2005/06, and 2007/08 to 2009/10 but recalled that:

- (i) the length frequencies reflect lengths of fish in the catch and not the whole population;
- (ii) there is a minimum size limit for *C. gunnari* in this fishery of 240 mm to protect juvenile fish (younger than 2.5 years) and that, if the proportion of fish smaller than this size exceeds 10% in a haul, then the vessel must move to a new fishing area;
- (iii) the modal lengths will be dependent on the time of year in which the fishery was prosecuted and the potential density-dependent growth that might occur (SC-CAMLR-XX, Annex 5, Appendix D; WAMI-01/4);
- (iv) abundance of fish cannot be inferred from these plots;
- (v) the cohorts represented in these plots need to be interpreted from the survey data, which surveys the whole population.

# 2. Stocks and areas

5. Within Division 58.5.2 this species is restricted to the shelf area in the vicinity of Heard Island in water generally shallower than 500 m. Previous analyses indicate that stocks on the Heard Plateau and Shell Bank have different size structures and recruitment patterns. In 1997 the Working Group agreed that in light of this, the two areas should be treated as separate stocks for assessment purposes (see SC-CAMLR-XVI, Annex 5). *Champsocephalus gunnari* have been absent, or present in very low abundances, on Shell Bank over recent years. Due to their low abundance observed in the current year, no assessment has been conducted for the Shell Bank stock since the 2007/08 season.

# 3. Parameter estimation

### 3.1 Estimation methods

### Standing stock

6. The results of a bottom trawl survey in 2010 were summarised in WG-FSA-10/12. The survey had been undertaken according to the same design as in previous surveys for this region. Estimates of SSB for the Heard Island Plateau were made using the bootstrap procedure using the routine outlined in Appendix 1 of WG-FSA-10/12. The location of sample stations in relation to Heard Island and McDonald Islands is shown in Figure 2.

Figure 2: Strata and sampling hauls from the 2010 random stratified trawl survey in Division 58.5.2 used in the 2010 *Champsocephalus gunnari* assessment. Points are locations of hauls, with 10 stations in Plateau West, 22 stations in Gunnari Ridge and 29 stations in Plateau Southeast.

#### Population structure

7. The distribution of densities-at-age was derived using the CMIX program and selecting the mean length for ages 2, 3 and 4 by eye (Table 2). The Working Group noted that the 2008 to 2010 Australian bottom trawl surveys had sampled a large cohort, which now dominates the population structure in 2010 as the 4+ year class (Figure 3). A new 2+ cohort was also detected. Details of the fit are presented in Table 3.

Parameter	Value
Size range included	180–455 mm
Bounds	Age 2: 250 mm
	Age 3: 300 mm
	Age 4: 350 mm
SDs related linearly to the mean	Yes
Bounds on intercept (start, step)	1, 50 (15, 1.0)
Bounds on slope (start, step)	0.0, 0.4 (1.0, 0.1)
No. function calls	1 000
Reporting frequency	100
Stopping criteria	1E-6
Frequency for convergence testing	5
Simplex expansion coefficient	1

Table 2:Input parameters for the CMIX analysis of Champsocephalus gunnari<br/>length density in Division 58.5.2.

Figure 3: Size distribution of *Champsocephalus gunnari* from the 2010 random stratified trawl survey in Division 58.5.2 with standard errors. Cohorts were present in ages 2, 3 and 4. The plot is dominated by age-4+ fish.

	Component 1 (age 2+)	Component 2 (age 3+)	Component 3 (age 4+)
Mean length (mm)	273	323	370
SD (mm)	14.9	16.3	17.6
Total density (numbers km <sup>-2</sup> )	309.6	44.1	1286.6
SD of component density	68.5	48.9	244.4
Sum of observed densities $= 165$	2.71		
Sum of expected densities $= 164$	0.19		
Intercept $= 7.296$			
Slope = 0.2784			

Table 3:Results generated from CMIX analyses for Champsocephalus gunnari<br/>in Division 58.5.2.

#### Other parameters

8. There were no changes to other parameter values.

#### **3.2** Parameter values

#### Fixed parameters

9. Growth parameters were re-evaluated from size-at-age for cohorts that were sufficiently large for their modal length and well characterised in assessments between 2000 and 2010 (WG-FSA-10/12). The other fixed parameters remain unchanged from previous assessments (Table 4).

Table 4:	Fixed parameters		used	in	the	2010	assessment	of
	Champ	socephalus gu	<i>nnari</i> in	Divi	ision 5	8.5.2.		

Component	Parameter	Value	Units
Natural mortality VBGF VBGF VBGF Length-to-mass	$egin{array}{c} M \ K \ t_0 \ L_\infty \ c_a^2 \end{array}$	0.4 0.379 0.057 438 2.629E-10	y <sup>-1</sup> y <sup>-1</sup> y mm kg/mm
Lengtn-to-mass	<i>b</i>	3.515	

#### Standing stock

10. Similar to last year, an estimate of SSB was calculated using the bootstrap procedure. The area of seabed sampled and an estimate of the one-sided lower 95% CI of biomass were calculated (Table 5).

Stratum	Estimate	SE	Lower CI	Upper CI	One-sided lower 95% CI
Gunnari Ridge	1 835	535	897	2 947	1 026
Plateau SE	1 560	364	917	2 320	1 005
Plateau W	4 051	873	2 469	5 674	2 715
Pooled	7 445	1 502	4 755	10 565	5 123

Table 5:Seabed areas within three geographic strata used to bootstrap estimates of biomass.<br/>Nominal date of survey = 4 April 2010.

### Removals

11. An estimated 400 tonnes of *C. gunnari* were caught following the survey (31 March to 8 April 2010).

#### Initial age structure

12. The proportion of density-at-age was derived from the CMIX program for ages 2+ to 4+. Modal lengths of the cohorts were estimated by eye (Table 6). Standard deviation of length-at-age was also estimated.

 Table 6:
 Calculation of the proportion of biomass-at-age derived from the survey length-density distribution.

Age class	Mean length (mm)	Density $(n \text{ km}^{-2})$	Mean weight (kg)	Proportion of biomass (%)
2+	273	309.5	0.097	0.075
3+	323	44.1	0.173	0.019
4+	370	1286.6	0.281	0.906

### Selectivity

13. A linear selectivity vector was used for *C. gunnari*, starting at 2.5 years and fully selected at age 3.

### Recruitment

14. The short-term projection of *C. gunnari* does not include recruitment data.

### Proportion of biomass-at-age

15. An estimate of the proportion of biomass-at-age was calculated and presented in Table 6. This demonstrates that the age-4+ cohort contributes the highest biomass of animals and is also the most abundant numerically.

#### 4. Stock assessment

#### 4.1 Model structure and assumptions

16. The GYM, used routinely for the assessment of long-term yield of other species in the CAMLR Convention Area, configured to perform the short-term projection, was used.

Category	Parameter	Values
Age structure	Plus class accumulation Oldest age in initial structure	10 years 11 years
Initial population structure	Age class density	See Table 2
Weight-at-age	Weight–length parameter $-A$ (kg) Weight–length parameter $-B$	2.6 x 10 <sup>-10</sup> kg 3.515
Maturity	$L_{m50}$ (set so that the status of the whole stock is being monitored) Range: 0 to full maturity	0 mm* 0 mm
Spawning season	Set so that status of the stock is determined at the end of each year	30 Nov-30 Nov
Fishery information	Upper bound to annual <i>F</i> Tolerance to finding <i>F</i> Tolerance for resolving catches	5 1E-08 0.01
Future projection	Age first selected Age fully selected Relative fishing effort	2.5 3.0 Date: 1 Dec, Effort: 1
2007	Selectivity varied from last Age first selected Age fully selected Relative fishing effort Catch	Yes 2.5 3.0 Date: 1 Dec, Effort: 0 Date: 15 Apr, Effort: 0 15 000 kg
Simulation specifications	Number of runs in simulation	1

### Model configuration

Table 7:GYM model configuration for the assessment of Champsocephalus gunnari in<br/>Division 58.5.2.

(continued)

Category	Parameter	Values
Individual trial Specifications	Years to remove initial age structure Year prior to projection Reference start date in year Increments in year Years to project stock in simulation Reasonable upper bound for annual $F$ Tolerance for finding $F$ in each year	1** 2009*** 1 Dec 365 2 5.0 0 000001
	e	

Table 7 (continued)

\* Maturity is not used in the short-term projection. It is set to 0 to allow the GYM to monitor the whole population.

\*\* Set to 1 since 15 tonnes were captured after the survey, else set to 0.

\*\*\* GYM requires first year of 2009/10 split-year.

#### Decision rules

17. To assess a catch level such that fishing should not, without any substantial risk, specified in this instance as no more than 5% probability:

reduce the spawning stock biomass to below 75% of the level that would occur in the absence of fishing within the two years following an abundance biomass estimate provided by a survey.

18. To achieve this, the one-sided lower 95% confidence bound of the biomass estimate for 2+ and 3+ age classes (91% of total estimated biomass or 482 tonnes) is used as the starting point for the projection. The 4+ age class is assumed to be lost later in 2010. An estimated 400 tonnes of icefish have been captured after the survey was conducted, and are assumed to have been taken in proportion to the cohorts seen in the survey. Therefore, the removals after the survey are scaled to reflect the likely impact only on the 2+ and 3+ age classes in the catch, and estimated at 38 tonnes.

### 4.2 Model results

19. A single deterministic short-term projection of yield in 2010/11 (year 1) was calculated for the Heard Plateau and Gunnari Ridge. Yield estimates derived from the short-term projections for the 2009/10 season are:

Target fishing mortality	Yield (tonnes)			
rate $(yr^{-1})$	2010/11	2011/12		
0.144	78	66		

20. The Working Group recalled its advice to the Scientific Committee last year that the catch limit for *C. gunnari* in Division 58.5.2 for the 2010/11 be zero (SC-CAMLR-XXVIII, Annex 5, paragraph 5.178). It also noted that the trawl survey conducted in March–April 2010 (WG-FSA-10/12) detected an incoming 2+ year class, and that the short-term projection model was properly applied to generate precautionary yields for the following two seasons

based on CCAMLR decision rules. However, the biomass from the survey was very low relative to historic levels, and the short-term projection model as applied will always yield a precautionary yield, no matter what the fishable biomass. The Working Group agreed that the Scientific Committee should consider these types of scenarios in light of the CCAMLR Performance Review Panel recommendation that a rebuilding strategy should potentially be employed for stocks with low levels of biomass.

### 4.3 Sensitivity analyses

21. No specific sensitivity analyses were undertaken at the meeting.

### 4.4 Discussion of model results

22. The projection of fish of 2+ and 3+ age classes from 2009/10 gives a projected yield of 78 tonnes in the 2010/11 season and 66 tonnes in the 2011/12 season. Yield estimates may alter after 2010/11 following the survey planned in 2010, as small juveniles may begin to be recruited to the survey gear.

### 4.5 Future research requirements

23. The Working Group recommended considerations whether the parameter estimates from the revised growth model were tracking population change in response to the environment or were due to changes in the way the CMIX method identified cohorts.

# 5. By-catch of fish and invertebrates

### 5.1 By-catch removals

24. The total reported by-catch (tonnes) of fish taken in the trawl fishery for *C. gunnari* in recent years is indicated in Table 8 from fine-scale C2 data.

Fishing season	LIC	Limit	NOS	Limit	GRV	Limit	SRX	Limit	Other	Limit
1995/96	0		0		0		0		0	5%*
1996/97	2		0		0		1		2	50**
1997/98	2	80	3	325	0		0	120	2	50
1998/99	1	150	0	80	0		0		0	50
1999/00	2	150	0	80	0		0		1	50
2000/01	1	150	0	80	0	50	0	50	0	50
2001/02	3	150	0	80	0	50	1	50	0	50

2003/04	6	150	0	80	1	360	3	120	1	50
2004/05	34	150	0	80	0	360	5	120	3	50
2005/06	29	150	0	80	0	360	7	120	2	50
2006/07	3	150	0	80	0	360	0	120	0	50
2007/08	8	150	0	80	0	360	2	120	7	50
2008/09	7	150	1	80	0	360	7	120	8	50
2009/10	51	150	0	80	1	360	12	120	3	50

Table 8: Total reported by-catch (tonnes) for four species between 1995/96 and 2009/10 in the *Champsocephalus gunnari* trawl fishery. Limits apply to all fisheries in Division 58.5.2. LIC – *Channichthys rhinoceratus*; NOS – *Lepidonotothen squamifrons;* GRV – *Macrourus* spp.; SRX – rajids. (Source: fine-scale data)

\* 5% move-on rule if individual haul exceeds 5%, limit not specified.

\*\* Move-on rule if catch of any by-catch species exceeds 5% of target species.

### 5.2 Assessments of impact on affected populations

25. Insufficient information was available to update assessments.

26. No stock assessments of individual by-catch species were undertaken in 2010. By-catch limits of *Channichthys rhinoceratus* and *Lepidonotothen squamifrons* are based on assessments carried out in 1998 (SC-CAMLR-XVII, Annex 5, paragraphs 4.204 to 4.206) and by-catch limits of the grenadier *Macrourus carinatus* are based on assessments carried out in 2002 and 2003 (SC-CAMLR-XXII, Annex 5, paragraphs 5.244 to 5.249).

### 5.3 Mitigation measures

27. CM 33-02 currently applies to this fishery. Move-on rules are included in the annual conservation measures established for this fishery (e.g. CM 42-02).

# 6. By-catch of birds and mammals

28. Seabird by-catch in the fishery targeting *C. gunnari* in Division 58.5.2 remains low with one observed seabird mortality for the 2009/10 season (Table 9).

Fishing season	Trawls observed	DAC	DIM	PRO	Other
2002/03	1309		2	2	2
2003/04	1215				
2004/05	1301		5	3	
2005/06	1086				
2006/07	936				2
2007/08	700				
2008/09	39				
2009/10	138	1			

Table 9:Number of seabirds killed in the trawl fishery in Subarea 48.3.DAC - Daption capense;DIM - Thalassarche melanophrys;PRO - Procellaria aequinoctialis.

29. No incidents of marine mammal by-catch have been observed while fishing for *C. gunnari* since 2005/06.

30. WG-IMAF did not meet in 2010, however, in 2009 it assessed the level of risk of incidental mortality of seabirds in Division 58.5.2 as category 4 (average-to-high) (SC-CAMLR-XXVIII, Annex 7, Table 13 and Figure 2).

### 6.1 Mitigation measures

31. The provisions of CM 25-03 apply to this fishery.

# 7. Ecosystem implications/effects

32. Bottom trawl and midwater trawl gear is used to target both *C. gunnari* and *Dissostichus eleginoides* in Division 58.5.2. The potential impacts of fishing gear on benthic communities are limited by the small size and number of commercial trawl grounds, a strategy of fishing trawling gear lightly, and the protection of large areas sensitive to the effects of bottom trawling (SC-CAMLR-XXIII, Annex 5, paragraph 5.211).

33. Research is currently being undertaken by Australia to develop ecosystem models for the Heard Island Plateau, including *C. gunnari* and their main predators, which will subsequently be used to inform management strategy evaluations on the *C. gunnari* fishery (SC-CAMLR-XXVI/BG/6, paragraph 21).

# 8. Harvest controls and management advice

# 8.1 Conservation measures

34. The limits on the fishery for *C. gunnari* in Division 58.5.2 are defined in CM 42-02. The limits in force and the Working Group's advice to the Scientific Committee for the forthcoming season are summarised in Table 10.

Element	Limits in force	Advice for 2010/11
Access (gear)	Trawling only.	Carry forward
Access (area)	Definition of area open for fishing. Chart illustrating area open (Annex 42-02/A).	Carry forward Carry forward
Catch limit	1 658 tonnes	Revise to 78 tonnes
Move-on rule	Move on if $>100$ kg caught of which $>10\%$ by number are less than minimum size (24 cm).	Carry forward
Season	1 December to 30 November	Same period
By-catch	By-catch rates as in CM 33-02 to apply.	Carry forward
Mitigation	In accordance with CM 25-03.	Carry forward
Observers	Each vessel to carry at least one scientific observer and may include one additional CCAMLR scientific observer.	Carry forward
Data	Ten-day reporting system as in Annex 42-02/B Monthly fine-scale reporting system as in Annex 42-02/B on haul-by-haul basis. Fine-scale reporting system as in Annex 42-02/B. Reported in accordance with the Scheme of International Scientific Observation.	Carry forward
Target species	<i>Champsocephalus gunnari</i> By-catch is any species other than <i>C. gunnari</i> .	Carry forward
Environmental protection	Regulated by CM 26-01. No offal discharge.	Carry forward

Table 10:Limits on the fishery for Champsocephalus gunnari in Division 58.5.2 in 2009/10<br/>(CM 42-02) and advice to the Scientific Committee for 2010/11.

# 8.2 Management advice

35. The Working Group recommended that the Scientific Committee consider a catch limit for *C. gunnari* in 2010/11 of no more than 78 tonnes.

36. The Working Group recommended that other measures in the conservation measure be retained.
